COMMENTS

Section shows monotonous population of intermediate sized atypical lymphoid cells having convoluted nuclear membrane, open chromatin, small distinct nucleoli and scant cytoplasm. Frequent mitosis is noted. Crushing artefact seen. Squamous epithelium is identified focally.

On immunohistochemistry, these atypical lymphoid cells are diffusely and strongly positive for vimentin, CD79a, PAX-5 and Tdt; while negative for CD45, CD3, CD20, S-100, NKX2.2, Myo-D1, myogenin, Pan CK (AE1/AE3), desmin and synaptophysin. CD99 AND BCOR shows weak patchy expression. INI-1 is retained in tumor cells. Ki67 proliferation index is approximately 60%.

Suggest correlation with bone marrow aspiration and peripheral blood smears.
